

TEST SUMMARY REPORT

Practical Exam – Associate QA Engineer

Prepared By: Ishara Herath

Date: 19th of July 2026

1. Scope and Environment Tested

- **Application Under Test:** Flame & Crust Web Application (Desktop & Mobile viewports).
- **Testing Period:** July 2026.
- **Core Modules Covered:** Sign up / Login, Outlet Selection, Order Now / Search, Cart (Add/Remove items), Checkout / Payment Flow, and Order History.
- **Test Environments:**

Browser 1- Google Chrome

Browser 2- Microsoft Edge.

Mobile Viewport: Emulated environment using Google Chrome DevTools (specifically tested using the iPhone 12 Pro view).

2. Test Execution Summary

Metric	Value
Total test cases	13
Pass	12
Fail	1
Blocked	0

3. Defecet Summary

Severity	Count
Critical	1 (BUG-006)
High	4 (BUG-002, BUG-005, BUG-008, BUG-009)
Medium	4 (BUG-001, BUG-003, BUG-004, BUG-007)
Low	0

Top 3 most impactful issues –

- **BUG-006 (Critical) - Booking Expiry UI Block:** The frontend completely blocks table reservations by showing a "Table no longer available" error when the local UI countdown hits zero, even though the backend API returns a successful 200 OK. This severely impacts conversion rates.
- **BUG-008 (High) - Uber Delivery API 403 Crash:** A credentials block on the third-party Uber Delivery API causes the entire backend to return an unhandled HTTP 500 crash. The UI misleads users by stating the address is "not deliverable," breaking the delivery ordering channel.

- **BUG-002 (High) - Session Cache Data Exposure:** Clicking the browser's "Back" button after logging out exposes personal user details (Name, Email, Phone, Postcode) in clear text due to lack of cache-control headers, creating a security risk.

4. Overall risk assessment and recommendation

Final Status: Not ready to ship

The application has critical blockages and security vulnerabilities that make it unsafe for a production environment at this stage.

- **Critical System Blockers:** Valid table bookings are completely blocked in the UI due to the countdown timer logic failing (**BUG-006**), and the entire checkout/delivery system crashes with an HTTP 500 error when the Uber API credentials fail (**BUG-008**).
- **Data Security Risks:** Users can view personal details (Name, Email, Phone, Postcode) in clear text simply by clicking the browser's "Back" button after logging out (**BUG-002**), creating a serious privacy leak.
- **Mobile Usability Issues:** Key navigation elements break completely on mobile devices, cutting off important category tabs and ruining the mobile user experience (**BUG-009**).

5. Suggestions for improvement

Product:

- Improve error handling for Third-Party APIs.
- Fix UI Validation Logic.
- Fix Mobile Responsive CSS.

Process:

- Perform regression testing before releases.
- Execute cross-browser and responsive testing.
- Add API validation tests.
